# A SIMPLE WAY TO IMPLEMENT API RP1173 AND INTEGRATE EXISTING REQUIREMENTS

Implement with Octane and immediately show your coverage and performance against all requirements you need to meet.

With Octane's management system software and mapping capability, you can implement and assess your organization against API RP 1173, and then create concordance maps and assessment reports for other requirements using one set of assessment data. For example, when you do an assessment of API RP 1173, you can then map to and create assessment reports for 49 CFR 192, your management system or other regulations and standards. Implementation and integration just got way easier.
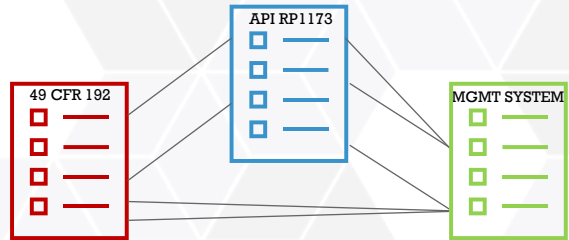

Octane Assessment of API RP1173 Mapped to Multiple Requirements

API RP1173 section 7.3 is being assessed on the left with mapped requirements displayed on the right. The API RP1173 observations and gaps captured during the assessment can be reported directly against these other mapped requirements immediately showing coverage and performance against all related requirements.

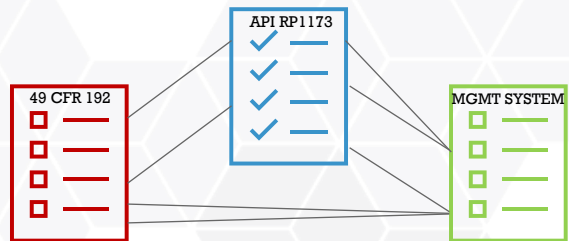

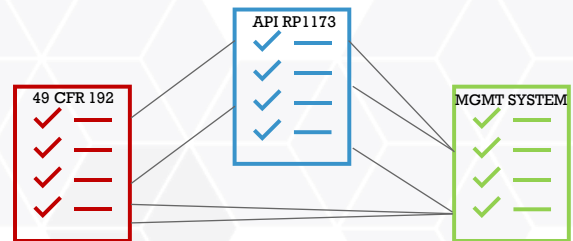

HOW IT WORKS

1. Map Requirements

2. Do an assessment against API RP1173 requirements

3. Show assessment results against 49 CFR 192, your management system or any other requirements
